The End of our World...

Public sentiment about AI is in the dumps. In just a few short years since AI has hit the scene, it has grown monstrosly from a toy we laughed at to an all-knowing workaholic that costs less than minimum wage

AI

White collar jobs
sneering
at blue collar
jobs

With a job market so bleak, why even try? It's so over...

A new study by BMG Research found **that 50% of students ages 18-24 are worried about artificial intelligence taking their future job prospects.** Students who already have to learn how to navigate

Even more alarming, a study by independent research firm Workplace Intelligence in partnership with Hult International Business School found that 37% of employers would hire AI over a young graduate.

AI is a very strong tool, and everyone is absolutely dreading it

The End of our world... Or not...?

But in reality, AI is not all that (yet). The problem really lies not just in the usefulness of AI, but the failure of the education system to prepare undergrads and young job seekers for real jobs

96% of employers agreeing that colleges are falling short in preparing students for the workforce,

AI has only exacerbated a problem that has always existed. Good grades can only get you so far, and not enough practical, hands-on learning is supplemented with that to fully grasp the skills you learn in school

Additionally, 77% of graduates reported learning more practical skills in their first six months of work than during their entire four years of college.

Custom Project AI

We are building a AI project which will help you Customize Industry courses you have taken in your course. It will generate Projects which you based on your profile and help you strengthen the courses contents.

Your answer

W

How much do you agree with the following statement: "Most online certifications focus more on what the company wants to teach than on the practical skills I need to build my own projects."

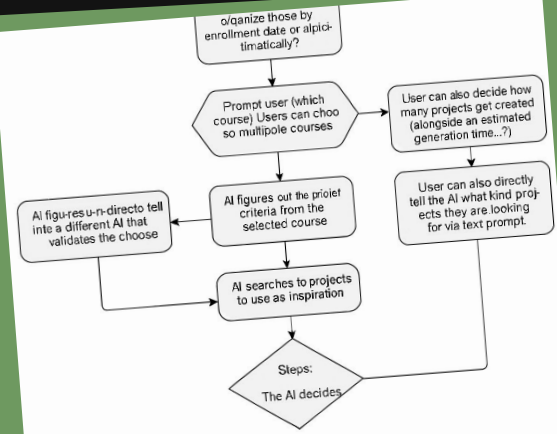

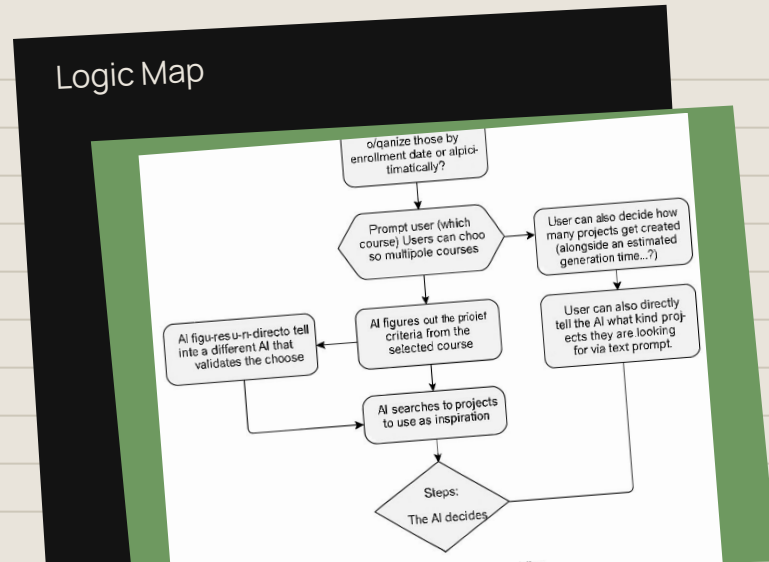

9 responses

Our Solution

To solve the root problem, we came up with a way for students to hone the skills they learn in school through AI to generate custom projects that are custom made not just for their interests, but for their classwork and skill level too. By integrating the user's Canvas submission scores, teacher submission comments, class syllabi, and other supporting information into an AI, it can generate a project that's perfectly tailored to your skill level.

For privacy/ethical reasons, information directly created by the teacher (course material, assignment instructions, etc.) outside the course syllabus will not be used in the AI model. Only the student's assignment grades and submissions will be used to tailor the projects to them

**...But, it's easier to just
show you**

Demo Time!

NEXT STEPS

GOAL 1

While our program works as it is now, it isn't able to get a good grasp on how the student evolves in knowledge over time

GOAL 2

While Canvas integration is a good start, nobody is going to want to use it unless it's somewhere convenient, like myASU or the ASU mobile app

GOAL 3

Right now, the program is mainly only useful for people with technical jobs like Engineers and software developers. We need to expand our target audience!

And that's about it

Any Questions? Ask now, or forever hold
your peace

Put together by these ✨ lovely ✨ people:

- **David Ekechukwu** → Project Lead & Visionary
- **Michael Howell** → Canvas/Database Backend Developer & Slides Creator
- **Mohammed Tauseef Ahmed** → AI Engineer, Frontend Developer, & Survey guy
- **Nandana Vikraman** → Website Design Lead, Frontend Developer, and Data Analyst
